Contents

1 Installing Flask-Init 3

2 Usage 5

3 Options 7

Flask-Init extension provides support for creating Flask application with ease. This includes creating boilerplate code from hello world application to complex blueprint apps in Flask.

CHAPTER 1

Installing Flask-Init

Install with **pip** and **easy_install**

```
pip install Flask-Init
```

CHAPTER 2

Usage

Flask-Init works in a similar way to Flask itself. Comes with default optional commands that can able to create Flask application for you.

```
$ flask init
```

CHAPTER 3

Options

```
--simple
```

Very simple flask application. Contains only one url endpoint that prints *Hello World*

```
--single-module
```

This is great for quick projects (like the ones used for tutorials), where you just need to serve a few routes and you've got less than a few hundred lines of application code.
